Representative Adaptive Trace

Case J04 | Observation-driven follow-up, visualization, and grounded reporting

PASSED

USER QUESTION

Which consecutive months had the largest increase in Divvy trips, which rider type contributed more, and can you create a line chart for those two months by rider type?

Adaptive trajectory

1 Initial calculation

Tool: analyze_data
Plan: Trip count grouped by month.

2 Observation

May: **502,615** trips
June: **678,801** trips
Largest increase: **176,186**.

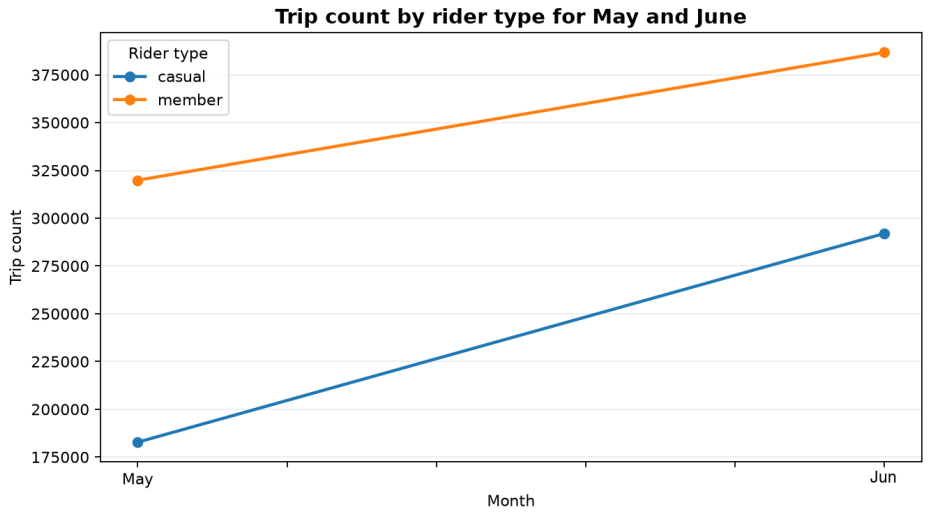

3 Adaptive decision

After seeing May-June, the model chose a rider-type breakdown. The trace records why this follow-up was required.

4 Follow-up calculation

Casual increase: **109,236**
Member increase: **66,950**
Casual riders contributed more.

Generated visualization

GROUNDED FINAL ANSWER

May to June had the largest increase: **176,186 trips**. Casual riders contributed **109,236** additional trips, versus **66,950** for members.

VALIDATION AND RUN METADATA

Claims match evidence	Chart exists	Follow-up is observation-driven	Requirements resolved
